# Motivation

**It's good to have**

## Behavioral diversity

Learn different ways to reach a goal

## Language-based goals

Respect set of constraints on the state space

<sup>1</sup>Intrinsically Motivated Goal Exploration Processes

# Motivation

A viable way to train instruction-following agents:

**Language-Conditioned RL (LC RL)**

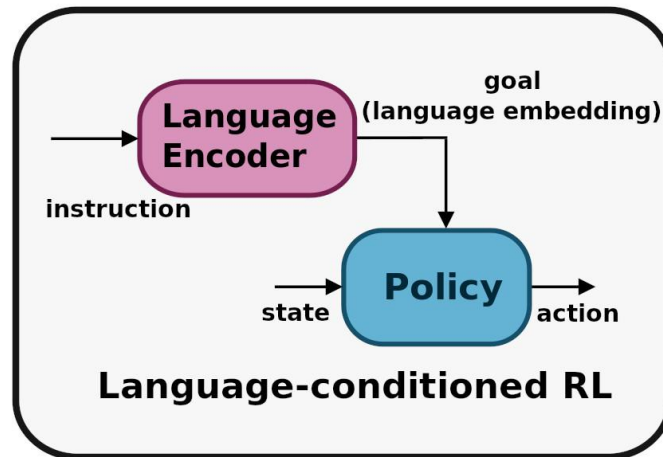

**However**

- ❖ LC RL agents require **language inputs** to behave and learn.

preverbal infants don't !  
(Mandler et al., 1978)

- ❖ LC RL limits **behavioral diversity**: there is one way to achieve one instruction.

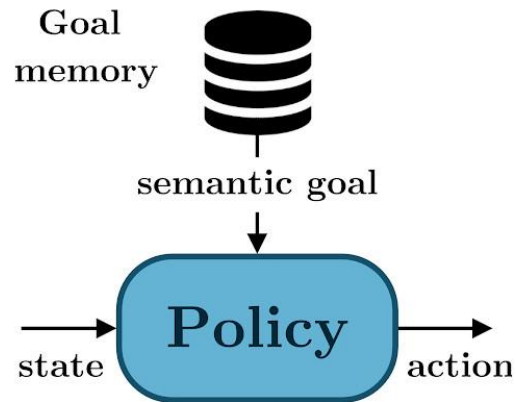

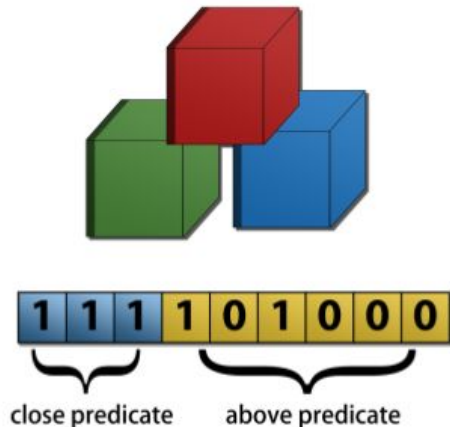

# A Novel architecture

- ❖ The **Language-Goal-Behavior** architecture (LGB) to decouple skill learning from language grounding via an **intermediate semantic goal representation**.
- ❖ DECSTR<sup>2</sup>, an implementation of LGB which operates through 3 phases:
  - Skill learning phase (**G**→**B**).
  - Language grounding phase (**L**→**G**).
  - Instruction following phase (**L**→**G**→**B**).

DECSTR shows good behavioral diversity !

## Skill Learning Phase (G→B)

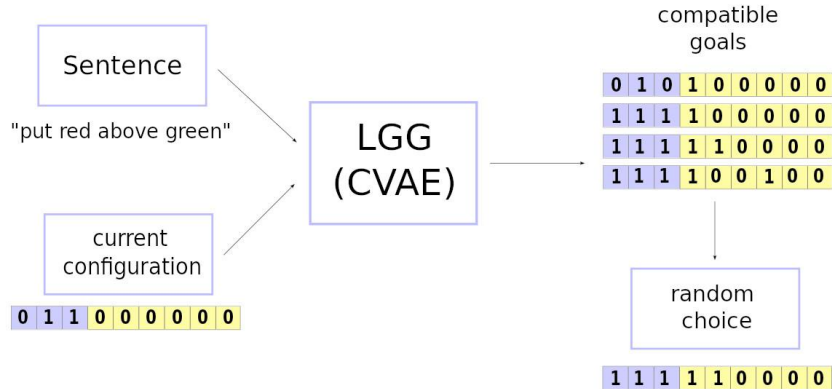

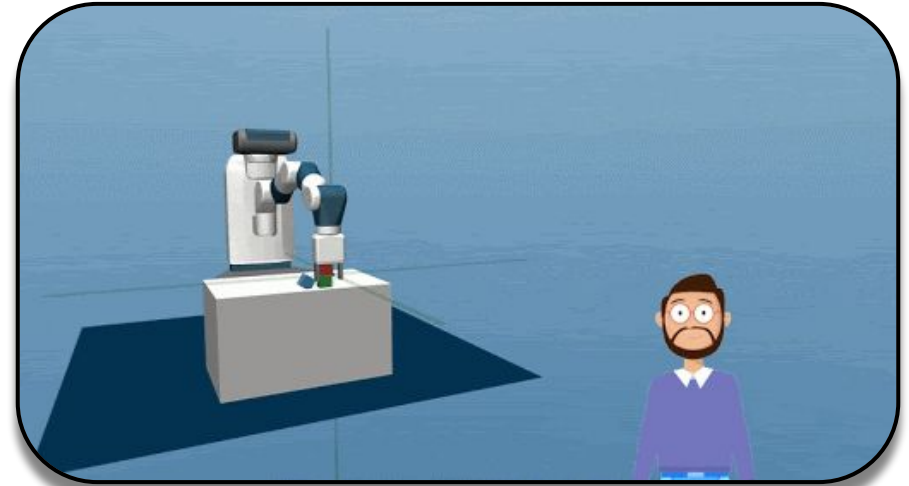

DECSTR uses 3 main components in the  $G \rightarrow B$  phase:

- ❖ Innate spatial predicate-based behavioral space (Mandler, 2012).
- ❖ Automatic Curriculum based on
  - aggregating of goals of similar difficulty.
  - selecting them according to the learning progress.
- ❖ Object-centered architecture that leverages Deep Sets (Zaheer et al., 2017).

# Language Grounding Phase ( $L \rightarrow G$ )

- A Social Partner (SP) describes one aspect of the transformations in object relations.

- We create a dataset to train the Language-Conditioned Goal Generator (LGG).

From an **initial configuration** and an **instruction**, it generates a **set of compatible goal configurations**.

## Instruction Following Phase ( $L \rightarrow G \rightarrow B$ )

Now, DECSTR is ready to follow instructions !

- It receives **natural language-based instructions** from a SP.
- It maps them to **semantic goal configurations** that it then **pursues**.

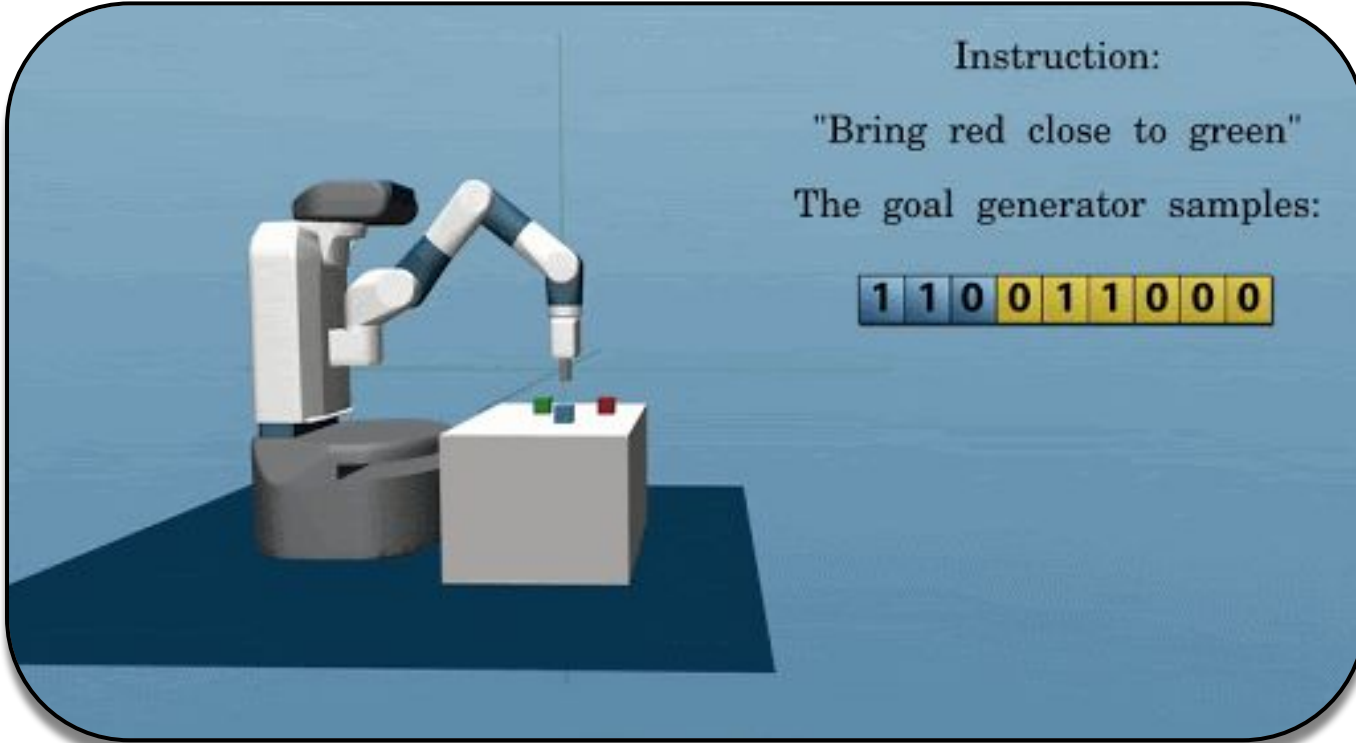

## Instruction Following Phase (L→G→B): Try again

Instruction:

"Bring red close to green"

The goal generator samples:

1	1	0	0	1	1	0	0	0
---	---	---	---	---	---	---	---	---

# Conclusion

The LGB architecture allows agents to learn alone or with a tutor through an intermediate semantic goal representation and a language-conditioned goal generator.

DECSTR is an instance of LGB that:

- masters predicate-based goals like preverbal infants ( $G \rightarrow B$ ),
- grounds language into its learnt behavior ( $L \rightarrow G$ ),
- pursues instructions with high behavioral diversity ( $L \rightarrow G \rightarrow B$ ).

Come and have a chat at the virtual poster.
